What is a Network license?

Problem

What is a Network license?

Environment

Microsoft Windows XP Microsoft Windows Server 2003 Microsoft Windows Server 2008 Microsoft Windows Vista Microsoft Windows 7

Resolution

A Network license is a license of a TEKLYNX product that behaves as a "floating license" hosted in a centralized location like a server. As an example, in the case of a Network 5-user license, the license would allow for the installation of the software on an unlimited number of computers, however, only five of those computers could run the software at the same time. In addition, the use of Terminal Services or remote access connections requires the use of a Network license. Network licensing also requires that all computers that will be used to access the software, must be on the same network. Any computer not on the common network will be unable to obtain a Network license.
